Creation of a Simple Online Store

The challenge involves developing a simple e-commerce application in Remix that allows users to view products, add items to the shopping cart, and review the contents of the cart. The application should be designed with a focus on responsiveness, ensuring an optimized user experience across various devices. Furthermore, it is essential that the project adheres to best practices in frontend development, ensuring code quality and interface usability are maintained.

Application structure

- Create an application in Remix with the following pages:
 - Homepage
 - Product detail
 - Optional: Shopping Cart
- There is a Figma file provided in the notes that should be used as the foundation of the project and reproduced as faithfully as possible

Homepage

- Implement a page displaying a list of products
- Make a request to fetch the list of products (you may use the API data provided in the notes)
- Each product should have a link to its detail page
- It should be possible to sort the list according to the user's preferences, as well as filter by category
- The product list should also include pagination

Product detail page

- Make a request to fetch the selected product (you may use the API data provided in the notes)
- All elements present in the Figma design should be added to this page. However, if you wish to include additional elements, that will be appreciated
- When clicking the “Add to cart” button, the product should be added to the cart

Optional - Shopping cart

- Implement a shopping cart page that fits within the layout of your application
- The user should be able to access the shopping cart from an icon in the header of the application
- The cart should display the added products, the quantity of each item, and the total
- The user should be able to remove products from the cart

Design

- Optional: Use Tailwind CSS to style the application
- The application should work well on both mobile and desktop devices

Development Resources

- [Figma](#)
- [Dummy JSON API](#)

Key Notes

- Appropriately utilize Remix's loader and action functions
- Pay attention to the Remix routing structure
- The project should be submitted on a version control platform
